

In total amount of hours, I think I spend anywhere from 24 to 33 hours on this assignment. I started the assignment the day after it was assigned, but I didn't get into testing and debugging till the week of the 17. I also only tested on Monday, Tuesday, and Wednesday because of studying for midterms. I found this homework to be a good challenge with all the freedom of how to implement functions and features. In the back of my head, I am wondering what future projects/homework's toward the end of the year is going to look like if the one in the middle is this large. I did learn a lot about my time management because I underestimated how much time I would need to test all my features and fix bugs. On my next assignment I will allocate more time to debugging and testing every feature, and if I have time adding more functions to help the user. The portion I had the most trouble with was the loans collection and main. Completing all the files like the collections and single collection were easy to make but making them work together and making a full system was the hardest part. I have no other comments related to my performance
